

Ahmed Ayman

Machine Learning Engineer

About Me

I'm Ahmed Ayman Fathy, a Machine Learning Engineer and Communications Engineering student at Zagazig University. I build end-to-end ML solutions across NLP, computer vision, and predictive analytics—from clean data pipelines to deployment.

Why do clients choose to work with me? I focus on measurable results—high accuracy, reliable performance, and fast, production-ready delivery. You'll get clear communication, solid documentation, and smooth collaboration backed by team management skills. I also offer model evaluation, optimization, and deployment (Flask/Streamlit/Docker) so you don't have to compromise on quality or speed. Explore my projects and let's discuss how I can help turn your data into decisions that matter.

Educational Background

B.Sc., Communications Engineering — Zagazig University (2022–2025)

Core: Signals & Systems, Probability & Statistics, Linear Algebra, Data Structures.

Relevance: Mathematical and programming foundations applied to ML projects.

Machine Learning Program (1 month) — NTI

Topics: Classification, Regression, Clustering, NLP, model evaluation & optimization, deployment (Streamlit/Flask/Docker).

Skills

Technical

- Python
- Scikit-learn
- TensorFlow
- NLP
- Docker

Soft

- Communication
- Teamwork
- Problem-solving

Work Experiences

National Telecommunication Institute (NTI)

Machine Learning Trainee — August 2025

- Completed intensive 1-month ML program.
- Worked on hands-on projects including IMDB Sentiment Analysis App (achieved 91% accuracy).
- Gained experience in model training, optimization, and deployment using Flask/Streamlit/Docker.

Offered Services

Model Development

Building ML models for classification, regression, clustering, NLP

Model Optimization

Improving accuracy & performance with tuning, feature engineering, evaluation

Deployment

Deploying ML apps via Flask, Streamlit Docker for real-world use

Data Analysis & Visualization

Cleaning, analyzing and visualizing data for insights & decision-making.

IMDB Sentiment Analysis

Type: Natural Language Processing (NLP)

Goal: Classify IMDB reviews into positive or negative to support better insights into audience sentiment.

Dataset: 50,000 balanced reviews (25K positive, 25K negative).

Approach: Text preprocessing (cleaning, lemmatization, TF-IDF + numerical features), model training, hyperparameter tuning.

Models Tried: Logistic Regression, SVM, Random Forest, Voting Classifier.

Result: Best accuracy **91.2%** (Voting Ensemble).

Deployment: Streamlit app for real-time predictions.
